ASX Announcement

Linius successfully demonstrates Video Virtualization Engine

Linius Technologies Limited (ASX: LNU) is pleased to announce that it has achieved the first live public demonstration of its revolutionary software suite, the Linius Video Virtualization Engine™.

The company conducted the demonstration via live webcast open to investors, media and members of the public.

Chief Executive Officer Chris Richardson demonstrated the achievement of the core patent claims, including:

- Creating a virtual index of a remote video file in an unknown location chosen at random;
- Disassembling the video DNA to control the components of the original file;
- Reassembling the video DNA on the fly to playout in a format different to the original file, without the need for transcoding; and
- Inserting content into the middle of video playout on the fly, demonstrating video personalisation.

Mr. Richardson was pleased to receive and answer questions from investors on a range of topics related to the demonstration and the company, including the industry segments of most immediate interest to Linius, its future investment plans, and the technology's applicability to digital rights management.

The company thanks all webcast participants and looks forward to commercialising the Video Virtualization Engine™.
